

THE VISION

The Blue Misairu BRZ project is a ground breaking one of a kind undertaking to dive deep into the unknown. The goal is to not only build the new 2.0ltr horizontally opposed 4 cylinder engine to produce power naturally aspirated, but to shatter any expected limitations. This 2 time award winning SEMA import car of the year reinvented the affordable sports car and lit a fire back into the tuner scene.

This project stems from my history in the Japanese import automobiles. With over 20 years of experience pulling every last bit of power out of an engine. We have surrounded ourself with the industries best companies to ensure impeccable results.

Plans are already in the works and the engine calculations have been done. The engine components are being custom machined spring 2014. We take pride in innovation and not duplicating others results. Pushing the boundaries, and thinking outside the box.

With our growing list of companies eager to see this to fruition as much as we do. Prepare to see the most phenomenal build in a long awaited time. We will be the flagship for these companies prototypes, expanding product lines with proven results.

If this sounds like a project suited for your company see our contact information below and follow us on Facebook, Twitter, and Instagram.
